Submitted (APR-2001) to the EMBL/GenBank/DDBJ databases.
-!- FUNCTION: ACTS UPON ELSTIN.
-!- CATALYTIC ACTIVITY: Preferential cleavage: Leu-|-Xaa, Met-|-Xaa and Phe-|-Xaa. Hydrolyzes elastin.
-!- SUBCELLUAR LOCATION: Secreted.
-!- SUBCELLUAR LOCATION: Secreted.
-!- TISSUE SPECIFICITY: PANCREAS.
-!- TISSUE SPECIFICITY: BELONGS TO PEPTIDASE FAMILY S1. ELASTASE SUBFAMILY.
                                                                                                                                                                                                                                                                                                         SEQUENCE FROM N.A.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

The invention relates to novel serine proteases designated BSSP5

(AAB11710-B11711), and to nucleic acids encoding them (AAA61733-A61734).

The invention also relates to vectors and transformants comprising BSSP5 nucleic acids; transgenic animals in which the expression level of BSSP5 nucleic acids; transgenic animals in which the expression level of BSSP5 nucleic and an mBSSP5 knockout mouse. The invention additionally encompasses anti-BSSP5 antibodies and methods of production of such antibodies, methods of BSSP5 detection using the antibodies, and the use of BSSP5 proteins or fragments as diagnostic markers for certain medical conditions or f.g., pancreatitis. A method for detecting pancreatitis comprising measuring BSSP5 concentration in the blood or urine, and a pancreatitis diagnostic agent containing an anti-BSSP5 isolated in a human brain cDNA library using degenerate PCR primers (AAA61745) based on conserved regions of serine proteases. The BSSP5 serine proteases and nuclectides encoding them are useful in detecting homologues, mutants and polymorphic variants in biological samples (e.g., blood, urine, brain, prostate gland, placenta, testis, pancreas and spleen) as diagnostic markers for conditions such as Alzheimer's alsease, epilepsy, cancer, inflammation, infertility, pancreatitis and prostatic hypertrophy. Sequence AAB11711 represents murine BSSP5 human brain and sequence AAB11711 represents
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö

The invention relates to novel serine proteases designated BSSP5

(AABI1710-B11711), and to nucleic acids encoding them (AAA6733-A61734).

The invention also relates to vectors and transformants comprising BSSP5 nucleic acids; transgenic animals in which the expression level of BSSP5 nucleic acids; transgenic animals in which the expression level of BSSP5 can be varied; and an mBSSP5 knockout mouse. The invention additionally encompasses anti-BSSP5 antibodies and methods of production of such artibodies, methods of BSSP5 detection using the antibodies, and the use of BSSP5 proteins or fragments as diagnostic markers for certain medical conditions, e.g., pancreatitis. A method for detecting mencreatitis comprising measuring BSSP5 concentration in the blood or urine, and a pancreatitis diagnostic agent containing an anti-BSSP5 antibody is also disclosed. Nucleotides encoding BSSP5 were initially isolated in a human brain cDNA library using degenerate PCR primers (AAA61744-A61745) based on conserved regions of serine proteases. The BSSP5 serine proteases and nucleotides encoding them are useful in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       213
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    61 SNAEPVQVLSIARAITHPNWNANTMNNDLTLLKLASPARYTAQVSPVCLASTNEALPSGL 120

```
proteins, called pancreatic cancer antigens, given in AAB54008 to
AAB5466. The human pancreatic cancer antigens have cytostatic,
neuroprotective, nootropic, immunomodulatory, relaxant, contraceptive,
gynaecological, cardiant and antilifammatory activities, and can be used
in gene therapy. The polynucleotide and proteins can be used for
preventing, treating, or ameliorating a medical condition or in assays
for diagnosing a pathological condition or a susceptibility to one in a
subject. Binding partners to the proteins and the activity of the
proteins can be identified. The pancreatic cancer antigens can be used to
detect, treat or prevent pancreatic disorders, especially cancer.
Agonists and antagonists to the antigens can be used to design nucleic
and antagonists to the antigens can be used to design nucleic
and disquistic methods. The proteins can be used to design nucleic
and disquistic methods. The proteins can be used to penerate antibodies
which are used to purify, detect and target the polypeptides, including
both in vivo and in vitro diagnostic and therapeutic methods. The
proteins can be used to treat or prevent neural, immune system, muscular,
reproductive, gastrointestinal, pulmonary, cardiovascular, renal or
proteins can be used to treat or prevent neural, immune system, muscular,
reproductive, gastrointestinal, pulmonary, cardiovascular, renal or
proteins can be used to treat or prevent neural, immune system, muscular,
reproductive, gastrointestinal, pulmonary, cardiovascular, renal or
proteins can be used to the present invention.

The sequences of the invention are useful for treating diseases and disorders such ascers (e.g. breast, colon, lung), immune-related diseases and disorders (e.g. inflammatory diseases and asthma), cardiovascular diseases and diseases, metabolic disorders (e.g. dispetes) brain or neuronal-associated diseases, metabolic disorders (e.g. diabetes) central or peripheral nervous system diseases, migraines, pain, sexual dysfunction, mood disorders, attention disorders, cognition disorders, hypotension, psychotic disorders, neurological disorders, hypotension, hypertension, psychotic disorders, neurological disorders, and dyskinesias. (e.g. Alzheimer's disease, parkinson's disease) and dyskinesias. Infections caused by human immunodeficiency virus (HTV), and non-viral
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 infections such as ocular disease (e.g. glaucoma) and macular degeneration. TADG-15 is an extracellular serine protease. It was found that TADG-15 is over-expressed in ovarian tumours. TADG-15 protein or its fragments of 9-20 residues that lack TADG-15 protease activity are useful for vaccinating an individual against TADG-15, having, suspected of having or at risk of getting cancer. Furthermore, the TADG-15 gene can be used as a diagnostic or therapeutic target in cancer. The present sequence was used in a sequence homology alignment with the catalytic domain of TADG-15.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Novel extracellular serine protease, termed tumor antigen-derived gene 15 protein overexpressed in carcinomas and DNA encoding it, for diagnosis, treatment, prevention of cancer, particularly breast,

a review of sequence homologies of several plasminogen activators.

Plasminogen is the principal serine protease zymogen in the extracellular fluids of vertebrates. Its active form, plasmin, is implicated in pericellular proteolysis associated with a wide range of physiological and pathological processes. Plasminogen expression is cyclusted by plasminogen activators which hydrolyse a peptide bond in plasminogen to convert it to plasmin or form tight binding complexes with plasminogen to convert it to plasmin or form tight binding complexes with plasminogen to spontaneously convert it to plasmin. The sequence homology analysis has identified a six amino acid peptide involved in plasminogen activation. This peptide is particularly useful when inserted between amino acid residues 644 and 645 of full length human confirmation. Those periods activators have been made based upon the plasminogen activation. Freegonition site of plasminogen binding proteins. The polypeptides are useful in preparing thrombolytic agents for treating blood clotting disorders such as heart attack.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Polypeptide with plasminogen activator activity useful as thrombolytic agent for treating blood clot disorders e.g. heart attack, comprises 10 amino acid peptide fragment for recognition or activation of

This sequence represents human plasminogen. Fragments of this sequence can be used in the compounds of the invention. Kringle 5 (K5) peptide fragments homologous to this sequence, are anti-anglogenesis agents. Specifically for treating or preventing cancer, particularly primary or metastatic solid tumours, carcinomas, sarcomas, lymphomas, haemangiomas. They can also be used for treating or preventing psoriasis, arthritis. They can also be used for treating or preventing psoriasis, arthritis. They can also be used to treat autoimmune or coular diseases, capillary proliferation within atherosclerotic plaque, haemophiliac joints, wound granulation, ulcers etc., also as contraceptives that inhibit ovulation and establishment of the placenta. K5 antisear or (art)agonists can be used similarly, optionally coupled to cytotoxic agents. Antagonists may be used to induce andiogenesis, e.g. for wound healing. The K5 peptides are also used to raise specific antibodies (Ab), for diagnosis and for afinity purification of K5 receptors. The K5 receptors may then be captually the peptides in biological samples. The K5 peptides (and K5 fission proceins) selectively inhibit proliferation of endothelial cells with low toxicity against normal cells. Typically they have then kingle 1-4 peptides.
                                                                                                                                                                                                                                                                                                                                           New kringle 5 peptide(s) and fusion proteins derived from plasminogen - useful as anti-angiogenesis agents for treating cancer, psorlasis, arthritis etc., including gene therapy
                                                                                                                                                                                                                                                                   Davidson DJ, Gubbins EJ, Wang J;

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Database : SwissProt_40:*

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
